

## **Composite Indicator Methodology**

→ We selected education expenditure, healthcare expenditure, access to sanitation and renewable energy consumption as indicators of sustainable development.

→ We wanted to compare countries with different income levels and from different regions. Hence, we selected Brazil, China, France, Nigeria and the USA.

→ We first normalized the data we obtained from the world bank using min-max normalization.

→ After that, as all our indicators were positive indicators, we summed up the normalized values for each country to get the composite indicator.
